

LEAF SPOT

Leaf spot refers to a class of diseases caused by a variety of fungus and bacteria. These diseases affect the surface of the leaves in distinct patches.

WHAT TO LOOK OUT FOR:

Leaf spot is the most prevalent in wet, humid weather. It affects the upper surface of leaves.

SIGNS OF DISEASE:

You can find spotting on leaves towards the interior of your tree's canopy. These spots can vary in size, shape and color. In some cases, fungal spores can be seen in the center of the spots. If allowed to progress, the affected leaves will eventually drop completely.

HOW TO TREAT:

PREVENTION

Fungus grows best in trees and shrubs that are overgrown and overwatered. Keep your plants properly pruned to maximize airflow and follow seasonal watering recommendations—ask your nursery professional for a copy of our watering guides.

FERTILIZER

The foundation of a healthy plant is its root system—stimulate root growth and maximize the health of your plants with monthly Super Charged Moon Juice™ applications. Couple this with routine applications of Landscape Soil Conditioner™ to ensure the soil is draining properly and not allowing those fresh roots to sit in stagnant water.

TREATMENT

Eliminate the fungal infection before it spreads by combining a quick copper treatment with a lasting systemic fungicide. Prune off and discard any heavily infected portions of the plants and keep the foliage dry as best as possible. Always disinfect tools in between cuts and different plants.
