

MEALYBUGS

This quick-spreading insect damages plants by feeding on sap, causing yellow and stunted growth.

WHAT TO LOOK OUT FOR:

Mealybugs emerge during the spring and can be found on stems between leaves and fruits.

SIGNS OF INFESTATION:

Mealybugs are a messy pest that leave honeydew on your plants, which leads to the growth of sooty mold. They also leave behind a white, waxy substance on their feeding sites.

HOW TO TREAT:

PREVENTION

An application of systemic insecticide at the onset of growing season can protect your plants from mealybugs.

FERTILIZER

Mealybugs damage their plant hosts by extracting sugars and nutrients from the leaves and stems. Give your plant its strength back with a combination of Super Charged Moon Juice™ and Moon Dust™.

TREATMENT

Combine a topical treatment with a systemic drench to get both a quick knockdown and lasting protection.
