

# WEEVILS

These insects damage both the roots of the plant in their larval stage, as well as the leaves while they are adults. The adults can spread quickly from plant to plant.

## WHAT TO LOOK OUT FOR:

Weevil grubs can be found in early spring, they reach their adult form in the summer. You will see them at the base of leaves and in your plant's soil.

## SIGNS OF INFESTATION:

Weevils will cause wilting on your plant's lower leaves, as well as browning at the leaf's base. Additionally, they severely weaken your plant's root system.

## HOW TO TREAT:

### PREVENTION

Prevent weevil infestations in the first place with an application of systemic insecticide at the onset of growing season.

### FERTILIZER

Once weevils have eaten away portions of the root ball, it is critical to give your plant the tools it needs to bounce back and re-grow a strong root system. We recommend a combination of Super Charged Moon Juice™ and Moon Dust™.

### TREATMENT

Tackle active infestations with a combination of topical insecticide for the adult weevils and a systemic drench for the larva.
